Toing by Swiggy

Why build a second app instead of a Budget tab inside Swiggy?

Viresh Sawant

Section 2, FT272051

THE STRATEGIC QUESTION

Toing's real question isn't what it is — it's why it's separate

Swiggy already has **190M+ users** and a trusted delivery network. It chose to launch a **brand-new app** for budget meals instead of adding a tab, a strategic bet on segmentation over convenience.

Toing, in one line: budget meals · ₹49–₹250 · hyper-local menus · Swiggy-owned backend

KEY COMPETITORS

The Strategic Bet: Why a Separate App

Separate App (Toing)

- + Undiluted low-price brand positioning
- + Freedom to break Swiggy's pricing/UX norms
- + Easier to sunset or spin off if it fails
- New install = new acquisition cost
- Zero shared order history or loyalty
- Fragments engineering & support effort

Budget Tab in Swiggy

- + Zero install friction — 190M+ users, day one
- + Inherits trust, ratings history, saved addresses
- + One codebase, one ops/support org
- Cannibalizes full-price core-app orders
- Budget positioning dilutes core Swiggy brand
- Harder to run aggressive, budget-only pricing

The bet only pays off if Toing wins users Swiggy's core app structurally can't — **and the checkout evidence later in this deck suggests it hasn't yet.**

User Persona

Rahul

21 year university student who enjoys home-cooked meals but is time poor. Wants online options with local flavours without the upscale pricing

Priya

24 year junior marketing analyst, working long hours at a startup, needs single-serving meals delivered after getting home

Ratings and Reviews

Service Related Complaints

- Misleading Delivery Timelines
- Delayed Orders
- Delivery Partner Allocation Issue

4.4★ looks fine — the 1★ tail says reliability is the real product

For a budget app, broken ETAs don't just hurt CSAT — they hit repeat-order rate and CAC payback directly

User Journey

Login screen

“Great taste delivered at **lowest rate**”

Toing's tag line highlights their core USP - targeting **MASS** market offering, budget friendly & affordable meals.

Native login support !

Swiggy is creating an eco-system to TAP opportunities in Tier-3 cities

Swiggy-login exists even in a “standalone” app — first crack in the separation thesis

Independent brand, dependent backend: Swiggy wants shared identity even while selling separation

User Journey

Let's try login with **Swiggy**

Bug found !

Broken Integration

Dead end situation, this directly affects "Activation Rate" and "Conversion Rate", For the first time user this drastically increase immediate drop-off & abandonment.

Impact on North Star Metrics (Successful First Orders)

L1 - Increase in drop-off rate

L2 - Decrease in conversion rate

This bug kills Swiggy's cheapest acquisition channel: its own users

Worse than a random bug — it breaks the highest-intent, lowest-CAC path into the funnel

User Journey

Let's just Skip for now !

login with phone number

TAP !

Enter phone number

Allow only "while using the app"

Phone-first login resets identity — no memory of Swiggy order history

Every onboarding choice trades friction against data and trust. Naming that tradeoff is the job

User Journey

“Meals under ₹99” leads the homepage — price beats relevance, by design

Arrival isn't conversion. Activation risk starts here, not ends here

User Journey

Candidate Aha moment: 2-tap add-to-cart — proven for Rahul, untested for Priya

A hunch becomes an insight only once it's measured per segment, not per app

User Journey

Add to cart, what will be the delivery charges?

View the cart, TAP!

Item Total: ₹60
Delivery Fee: ₹25
Government Taxes: ₹7.50

Cart total looks right — but does checkout honor the “lowest rate” promise?

Setting up the real test of Toing's core brand claim, one tap from the reveal

Item Total - ₹60
Delivery Fee - ₹25
Govt. Taxes ₹7.50
To Pay ₹93

This kind of issues instantly **kills** user trust and destroys customer's **loyalty** towards the brand

Is this a **Rounding bug** ?
OR
Hidden charges !

Impact on Checkout

Cart Abandonment - L1 (Immediate)
User will immediately drop-off from the cart - without completing the Checkout !

Order Conversion Rate - L2 (Downstream Impact)
Decrease in conversion rates will directly hurt the revenue

₹25 delivery fee on a ₹60 item = 42% surcharge — the promise breaks at checkout

Bug or undisclosed fee, the business risk is identical: abandonment, conversion, repeat-order intent

Quick price comparison

Same product different price

toing

₹60

₹75

Swiggy

Menu price wins vs. Swiggy — but does the all-in price survive the ₹25 delivery fee?

If fees erase the discount, the USP is a menu-page illusion, not a checkout reality

Growth Metrics

North Star Metrics ✨

Successful First Order Delivered per week

of unique users placed their first order within a **7-day** window

L1 (Immediate)

Cart Abandonment Rate

$$\frac{\text{\# of users who abandoned a cart}}{\text{\# of users who created a cart}} \times 100$$

L2 (Downstream)

Overall **Order Conversion Rate**

$$\frac{\text{\# of Successful Order Completed}}{\text{\# of Total App Opens (Sessions)}} \times 100$$

Is “First Orders” really the bottleneck? The evidence says retention, not acquisition

Add a guardrail metric — delivery SLA adherence — or growth improves while trust keeps eroding

Opportunity Map & Prioritization

Fix checkout transparency first — it directly attacks the brand promise

90 Days / 6 Months / 12 Months

90 DAYS

6 MONTHS

12 MONTHS

Protect the promise

Fix checkout-fee transparency and the Swiggy-login dead end before adding anything new.

Build frequency

Campus & office subscription pass — aimed at Rahul's and Priya's actual JTBD frequency, not generic discounts.

Re-decide the bet

Revisit separate-app vs. Swiggy tab using real retention data.

Thank You
